

We are advertising every new car for more than the price we actually sell it for.

Autotrader and cars.com · Every price below was read off the live sites on 27 July 2026

Our website is correct. The feed we send to the marketplaces is not. It sends each car's price **before** the factory customer bonus is applied. So the shopper on Autotrader or cars.com sees a higher number than the one we will actually take — and a higher number than our own website shows them.

WHAT IT LOOKS LIKE ON ONE CAR

2026 Tiguan SE R-Line Black · Stock W19519

Our website shows the customer	\$39,073
Autotrader and cars.com show	\$41,573

We are advertised above our own price by \$2,500

Same car, same day, same dealership. The \$2,500 is the factory Customer Bonus — it is already on our website and already funded by VW.

HOW BIG IT IS

128 of 136

New cars carrying a bonus neither site is showing

136 of 136

Cars where the pattern holds — zero exceptions

Total factory money invisible to shoppers right now: **\$368,500 on Autotrader** and **\$463,428 on cars.com**.

Same cars on both sites — not additive. cars.com is higher because that site also expects dealer fees quoted separately, and ours are inside the price.

WHY IT COSTS US — SHOPPERS SORT BY PRICE, AND WE ARE SORTING OURSELVES DOWN

Tiguan SE R-Line

shown 3rd of 5

→

actually 1st

21 in stock — we look mid-pack, we are the cheapest.

Atlas SE w/Tech

shown last of 3

→

actually 1st

13 in stock — a rival lists the same MSRP \$2,900 above our real price.

Our two deepest-stocked models — 34 cars. A shopper filtering by price never reaches us. **This is consistent with the share we have lost since the pricing tool changed:** the previous tool published the after-rebate price; the current feed does not.

WHAT WE ARE NOT ASKING FOR

- Not a price cut.** Not one dollar of gross changes.
- Not our money.** The bonus is factory cash, already funded.
- Not a new offer.** It is the same price we already advertise on our own website and already honor in the store.

We are asking to publish the price we are already selling at.

THE FIX

One field in each feed. Not a project.

- cars.com** — send the after-bonus price, and move the \$698 dealer fee out of the price field.
- Autotrader** — send the after-bonus price, keep the fee in the price, and take it back out of MSRP.

The two sites quote fees differently, so one global change fixes one and breaks the other. They must be set separately.

IF YOU HEAR THIS IN THE ROOM

<i>"The pricing on our site is right."</i>	It is. This is only about what we transmit to Autotrader and cars.com.
<i>"We can't advertise that low."</i>	We already do — on our own website, today, on the same cars.
<i>"That's a margin giveaway."</i>	No gross moves. The bonus is factory money we already deduct at the desk.
<i>"The feed is working as designed."</i>	It is mapped to the wrong price column. 136 of 136 cars, zero exceptions — that is a setting, not a bug we are guessing at.

The Tiguan Customer Bonus ends 31 August 2026.

Roughly five weeks. Every day it stays wrong, 128 cars are advertised above their real price on both major marketplaces — during the window VW funded the bonus to move them.
